TaskFlow

Plan • Organize • Achieve

Final Grading Criteria

Personal & Collaborative Project Management Platform

PROGRAM	**DEPI**
DOCUMENT	**Final Grading Criteria**
TOTAL	**100 marks**
PREPARED	**14 October 2026**
STATUS	**Team-proposed rubric, not official DEPI**
AI	**Out of scope**

1. Purpose and status

This document proposes a transparent 100-point rubric for evaluating the TaskFlow project across documentation, implementation, testing, and final presentation. It is a **team-proposed assessment framework**, not an official DEPI grading rubric. The DEPI instructor or evaluator's approved criteria and weightings take precedence.

The rubric is tailored to TaskFlow, a project and task management system built without AI features. Evaluation should be based on the approved requirements and the functionality actually demonstrated or evidenced; planned features must not be presented as completed work.

2. Overall mark distribution

Assessment area	Marks	Weight
Documentation	25	25%
Implementation	40	40%
Testing and quality assurance	20	20%
Final presentation and demonstration	15	15%
Total	**100**	**100%**

3. Documentation — 25 marks

Criterion	Marks	Evidence / what is assessed
Project proposal and requirements	5	Clear problem statement, intended users, objectives, project scope, functional and non-functional requirements, and explicit exclusions.
Literature review and problem validation	4	Relevant sources and competitor/context review; validation methods and findings are accurately reported. Uncompleted interviews or validation activities are clearly marked as pending rather than claimed as completed.
System analysis and design	6	Consistent architecture description, use cases/workflows, database/entity design, diagrams, and interface or navigation design where applicable. Designs should agree with the implemented system.
Project management documentation	5	Project plan and timeline, milestones and deliverables, task assignment and roles, risk assessment and mitigation, KPIs, and suggested improvements.
Quality, traceability, and repository organization	5	Documents are readable, consistent, versioned/organized in GitHub, use reliable references where needed, and make it possible to trace requirements to implementation and tests.
Documentation subtotal	**25**	

Expected evidence: the proposal, project plan, team assignment, risk register, KPI definitions, requirements/design documentation, testing documentation, final report, and organized project repository. Include only documents that are actually completed and available.

4. Implementation — 40 marks

Criterion	Marks	Evidence / what is assessed
Required features and workflow completeness	12	Core user journeys work from start to finish, including workspaces/projects, task management and Kanban, team collaboration, and the approved time-planning and client-facing workflows in scope. Features are assessed against the agreed requirements, not against unapproved extras.
Architecture and code quality	6	Appropriate separation of concerns, maintainable naming and structure, dependency injection, reusable components, and suitable use of the agreed ASP.NET Core / Entity Framework Core architecture and patterns.
Database design and data integrity	5	Appropriate entities and relationships, keys/constraints, migrations, validation, consistent persistence, and protection against invalid or inconsistent state.
Authentication, authorization, and security	5	Secure sign-in and account flows; access is restricted by user, workspace, project, role, and client permissions as applicable; inputs and uploaded files are validated; secrets are not committed to the repository.
UI/UX and responsive behavior	4	Consistent TaskFlow visual design, clear navigation and feedback, responsive layouts, accessible controls, readable status indicators, and usable forms and boards.
Integration and collaboration behavior	4	Connected modules function together; comments, notifications/real-time updates, task dependencies, time entries, client reviews, or other approved integrations behave correctly where implemented.
Deployment and configuration	2	The application can be configured and run using documented steps; environment-specific settings are handled safely; a working deployment or reproducible local setup is provided.
Team collaboration and Git workflow	2	Meaningful commits, branches/pull requests or equivalent review evidence, resolved integration conflicts, and clear evidence of each member's contribution.
Implementation subtotal	**40**	

Scope note: score functionality according to the final, approved scope. If a feature was explicitly deferred, document the decision and assess its handling against the scope and requirements rather than marking an unimplemented feature as complete.

5. Testing and quality assurance — 20 marks

Criterion	Marks	Evidence / what is assessed
Test strategy and requirements coverage	3	Test plan identifies important workflows, expected results, test environment, and how requirements are covered.
Unit tests	5	Meaningful tests cover important business rules, validation, permission rules, and failure cases; tests are repeatable and their results are recorded.
Integration and API tests	4	Relevant database, authentication, API, and cross-module interactions are tested, including successful and unsuccessful requests.
End-to-end and acceptance tests	4	Representative user journeys are demonstrated and checked, such as creating a project/task, assigning work, changing status, recording time, and completing any in-scope client review workflow.
Defect handling, regression, and results	4	Defects are logged with severity and reproduction steps, fixes are retested, regression checks are performed, and actual test outcomes are reported honestly.
Testing subtotal	**20**	

Testing marks should reflect evidence, not just the existence of a test folder. Do not claim that tests passed unless they were executed and the results were recorded.

6. Final presentation and demonstration — 15 marks

Criterion	Marks	Evidence / what is assessed
Presentation structure and clarity	3	The presentation explains the problem, target users, objectives, scope, solution, architecture, and key decisions in a clear sequence.
Live demonstration	5	A prepared, working demo shows the main user journeys with realistic sample data and explains outcomes. Any known limitations are acknowledged.
Technical understanding and questions	4	Team members can explain their own modules, key design decisions, database and authorization choices, testing, limitations, and how modules integrate.
Team participation	2	Contributions are distributed appropriately; members can explain their work and answer relevant questions without relying on one presenter for everything.
Timing and professionalism	1	The team respects the allotted time, uses readable slides, and handles the demo and questions professionally.
Presentation subtotal	**15**	

7. Performance levels

Use the following guide to award marks within each criterion. The percentages are guidance for this proposed rubric, not official DEPI rules.

Performance level	Suggested proportion of criterion marks	Description
Excellent	90–100%	Complete, correct, well evidenced, and consistent with the approved requirements.
Good	75–89%	Largely complete and correct, with minor gaps that do not undermine the main outcome.
Developing	50–74%	Partially complete; visible gaps, inconsistent behavior, or limited evidence remain.
Incomplete	1–49%	Major gaps, weak evidence, or significant correctness/usability issues.
Not demonstrated	0%	No usable evidence was provided, or the criterion could not be verified.

8. Evidence collection and scoring process

1. Freeze the set of approved requirements and record any approved scope changes before final scoring.
2. Collect evidence for each criterion: document links, commit/PR history, screenshots where useful, test results, deployment/run instructions, and demo checklist.
3. Score each criterion individually, then add the four category subtotals. The final total must not exceed 100.
4. Record deductions with a short evidence-based reason. Avoid deducting marks twice for the same issue unless it independently affects different criteria.
5. Separate team-level quality from individual contribution. Use repository history, module ownership, review activity, and each member's ability to explain their work as evidence; any individual adjustment should follow the instructor's policy rather than an invented rule in this document.
6. Ask the DEPI instructor/evaluator to confirm or replace this proposed weighting before treating it as the official grading scheme.

9. Suggested final evaluation sheet

Category	Maximum marks	Awarded marks	Evidence / comments
Documentation	25	To be completed	
Implementation	40	To be completed	
Testing and quality assurance	20	To be completed	
Final presentation and demonstration	15	To be completed	
Final score	**100**	**To be completed**	

Important: No actual score, lecturer feedback, or official DEPI weighting is asserted in this document. Fill in awarded marks only after evaluation and retain the evaluator's comments or approved rubric as supporting evidence.
