TaskFlow

Plan • Organize • Achieve

Stakeholder Analysis

Personal & Collaborative Project Management Platform

PROGRAM	**DEPI**
DOCUMENT	**Stakeholder Analysis**
STAKEHOLDERS	**11 groups identified**
PREPARED	**14 October 2026**
STATUS	**Team-proposed; pending lecturer review**
AI	**Out of scope**

1. Purpose

This document identifies the people and groups that can influence TaskFlow or are affected by it. It describes their interests, needs, level of influence, and the communication or engagement approach planned for the project.

TaskFlow is a project and task management system designed for individuals, freelancers, teams, and organizations. Its core capabilities include workspaces and projects, task management and Kanban boards, collaboration, time tracking, calendars and Gantt planning, client-facing project visibility, deliverable review, reporting, notifications, and role-based access. The project uses rule-based logic where relevant and does not include AI features.

> **Planning note:** This is the team's proposed stakeholder analysis. Stakeholder priorities and expectations should be reviewed with the lecturer and any available representative users before final sign-off.

2. Stakeholder Identification

ID	Stakeholder	Type	Main Interest	Influence	Priority
S1	DEPI lecturer / project evaluator	External	Meets project requirements, sound engineering, clear documentation, testing, and presentation	High	High
S2	TaskFlow development team (five members)	Internal	Clear scope, manageable workload, integration, learning outcomes, and successful delivery	High	High
S3	Individual users	External / End users	Personal task organization, quick capture, reminders, and a simple personal dashboard	Medium	High
S4	Freelancers	External / End users	Managing work for multiple clients, tracking time, monitoring deadlines, and sharing deliverables	Medium	High
S5	Team members and project collaborators	External / End users	Clear ownership, Kanban workflow, comments, handovers, shared files, and current project status	High	High
S6	Team leads / project managers	External / End users	Project planning, workload visibility, milestones, dependencies, progress reports, and project-health indicators	High	High
S7	Clients / customers	External	Controlled visibility into progress, reviewing deliverables, approving versions, and requesting changes	Medium–High	High
S8	Workspace owner / organization administrator	External / Administrative user	Managing workspaces, members, roles, permissions, project settings, and access	High	High

ID	Stakeholder	Type	Main Interest	Influence	Priority
S9	Platform administrator / support operator	Internal / Operational	Managing platform-level configuration, investigating issues, and maintaining safe operation	High	Medium–High
S10	Hosting / cloud service provider	External / Technical dependency	Correct service use, supported configuration, resource usage, and platform availability	Medium	Medium
S11	Future maintainers / developers	Internal / Future stakeholder	Understandable architecture, reliable tests, useful documentation, and maintainable code	Medium	Medium

Influence definitions: High means the stakeholder can materially affect scope, acceptance, permissions, or delivery. Medium means they can affect adoption, usability, or a specific technical area. **Priority** reflects how much attention their needs should receive during the current project.

3. Needs and Expectations by Stakeholder

S1. DEPI Lecturer / Project Evaluator

- **Needs:** Clear problem definition and scope; consistency between requirements, design, implementation, and reports; evidence of working functionality; test results; and a structured final presentation.
- **Success evidence:** Approved project documents, traceable requirements, demonstrable user journeys, test records, and an honest list of limitations.
- **Engagement:** Ask for clarification when assessment expectations are unclear, submit required deliverables on time, and record feedback and agreed actions.

S2. Development Team

- **Needs:** A shared scope, clear module ownership, a stable data model and API contract, agreed coding conventions, manageable work packages, and an integration process that limits merge conflicts.
- **Success evidence:** Reviewed pull requests, integrated features, passing tests, updated documentation, and no unresolved critical defects at release.
- **Engagement:** Hold short planning and review meetings, track tasks on the team's board, raise blockers early, and use GitHub issues and pull requests for technical decisions.

S3. Individual Users

- **Needs:** Fast registration and sign-in, a personal dashboard, a quick way to capture tasks, clear due dates and priorities, search, saved views, and notification preferences.
- **Success evidence:** Users can create, find, prioritize, and complete personal tasks without needing to configure a team workspace first.
- **Engagement:** Validate flows with a small set of representative users where available; gather feedback on usability and navigation.

S4. Freelancers

- **Needs:** Separate projects and clients, time entries associated with tasks, deadline and milestone visibility, progress summaries, and controlled sharing of project updates and deliverables.

- **Success evidence:** A freelancer can manage more than one project, review recorded working time, and share only the intended project information with a client.
- **Engagement:** Validate representative freelancer workflows and check that client access is limited to explicitly shared content.

S5. Team Members / Collaborators

- **Needs:** Clear task ownership and status, board-based workflow, subtasks and checklists, comments and mentions, attachments, activity history, and handover notes when work changes hands.
- **Success evidence:** Teammates can understand what needs doing, who owns it, what has changed, and what remains blocked without relying only on private messages.
- **Engagement:** Use scenario-based walkthroughs and gather feedback about task clarity and collaboration.

S6. Team Leads / Project Managers

- **Needs:** Project setup and templates, milestones and dependencies, calendar and Gantt views, time reports, progress summaries, and rule-based health alerts for conditions such as overdue tasks or at-risk milestones.
- **Success evidence:** A lead can identify late or blocked work, understand its cause from the available data, and coordinate corrective action.
- **Engagement:** Review planning and reporting views against realistic project scenarios; make alert rules understandable and avoid presenting estimates as guaranteed outcomes.

S7. Clients / Customers

- **Needs:** A simple client portal or project live room, access restricted to approved information, shared deliverable versions, review comments, approval or change-request actions, and visibility into agreed milestones.
- **Success evidence:** A client can review a shared deliverable, approve it or request changes, and see the outcome without gaining access to internal tasks or unrelated projects.
- **Engagement:** Test permissions from a client account and verify the complete submit–review–approve/request-changes workflow.

S8. Workspace Owner / Organization Administrator

- **Needs:** Workspace settings, invitations, membership management, role assignment, project access control, and understandable permission boundaries.
- **Success evidence:** Authorized owners can manage membership while users cannot access workspaces or projects they are not permitted to see.
- **Engagement:** Review role definitions and perform authorization tests for both allowed and denied actions.

S9. Platform Administrator / Support Operator

- **Needs:** Secure administrative access, useful error information, auditability for important operations, and a clear procedure for handling configuration or user-reported problems.
- **Success evidence:** Administrative actions are restricted to authorized accounts and significant changes can be investigated where the implementation supports audit records.
- **Engagement:** Maintain an issue log and test administrative permissions. Avoid exposing passwords, tokens, or unnecessary personal information in logs.

S10. Hosting / Cloud Service Provider

- **Needs:** Correct deployment configuration, supported runtime and database settings, appropriate resource usage, and compliance with the provider's service limits.

- **Success evidence:** The deployed application starts reliably, configuration secrets are not committed to the repository, and a basic deployment health check passes.
- **Engagement:** Follow provider documentation, monitor available deployment and resource logs, and keep a recovery or redeployment procedure.

S11. Future Maintainers / Developers

- **Needs:** Clear module boundaries, readable code, database and API documentation, reproducible setup instructions, automated tests, and documented known limitations.
- **Success evidence:** A new contributor can set up the project and safely modify a module without depending on undocumented knowledge.
- **Engagement:** Keep the README and technical docs current, require review for significant changes, and preserve regression tests for critical workflows.

4. Power–Interest Matrix

Category	Stakeholders	Engagement Strategy
Manage closely — high influence, high interest	Lecturer/evaluator, development team, workspace owners, team leads	Frequent updates, explicit decisions, early reviews of scope and high-risk flows
Keep satisfied — high influence, comparatively lower day-to-day interest	Platform administrator, hosting provider	Provide the information needed for access, security, deployment, and operational readiness; raise major risks promptly
Keep informed — high interest, moderate influence	Individual users, freelancers, collaborators, clients	Usability walkthroughs, release notes, feedback collection, and clear explanations of available features
Monitor — currently limited or indirect involvement	Future maintainers and other potential user groups not yet consulted	Maintain clear documentation and review relevance as the project scope or feedback changes

This matrix is an initial planning assumption, not a claim that interviews or a formal stakeholder survey have already taken place.

5. Communication and Engagement Plan

Stakeholder	Communication Method	Suggested Frequency / Trigger	Owner
Lecturer / evaluator	DEPI meetings, submitted documents, demonstration, feedback log	At required checkpoints and when clarification is needed	Mostafa (Team Lead)
Development team	Team meeting, GitHub Issues/Projects, pull requests, shared documentation	Weekly review and whenever a blocker or cross-module dependency appears	All members; Mostafa coordinates
End users (individuals, freelancers, collaborators)	Short interviews, task-based usability walkthroughs, feedback form	During requirements validation and before final demonstration, if participants are available	Relevant module owner; Mostafa coordinates
Team leads / workspace owners	Scenario walkthroughs and role/permission review	During project planning and integration testing	Ahmed, with relevant module owners
Clients	Client-portal walkthrough and permission test	When client-facing workflows are integrated and during acceptance testing	Eman
Platform administrator / hosting provider	Deployment checklist, configuration notes, issue reports	Before deployment and when deployment or operations issues occur	Mostafa and the responsible technical owner
Future maintainers	README, architecture notes, API documentation, setup instructions	Updated with significant changes and before final handover	All members; Mostafa checks consistency

The frequencies above are recommendations for the project team, not completed activities or official DEPI rules.

6. Stakeholder Requirements and Acceptance Traceability

Stakeholder Need	Related TaskFlow Capability	Validation Evidence
Personal organization	Personal dashboard, My Work, Quick Capture, search, saved views	Create, update, find, and complete a personal task
Team coordination	Workspaces, invitations, roles, projects, task assignment	Verify invitation, membership, and permitted project access
Task clarity	Kanban, statuses, subtasks, labels, comments, attachments, handover notes	Complete a multi-step task workflow and inspect activity history
Schedule and time visibility	Timer, time entries, calendar, Gantt, dependencies, milestones, reports	Record time against a task and display project dates and dependencies
Client transparency	Client Portal / Project Live Room, shared deliverables, version review	Client sees only authorized information and can review a shared version

Stakeholder Need	Related TaskFlow Capability	Validation Evidence
Controlled changes	Change requests with scope, schedule, and cost impact fields before approval	Submit a request and verify it is not treated as approved until an authorized decision is recorded
Project risk awareness	Rule-based health alerts	Trigger a documented rule (such as an overdue task) and verify its alert condition
Assessment and maintainability	Documentation, tests, reproducible setup, final demonstration	Review submitted documents, test results, and the running application

7. Key Stakeholder Risks and Responses

Risk	Potential Effect	Response
End-user needs are assumed without validation	The delivered flows may not match actual expectations	Label assumptions clearly; validate core workflows with representative users where available
Lecturer expectations are misunderstood	Rework or missing assessment evidence	Confirm required deliverables, rubric, and demonstration expectations as early as possible
Client and internal permissions are unclear	Sensitive project information could be exposed	Define role and resource-level authorization rules; test allowed and denied scenarios with separate accounts
Team members interpret requirements differently	Inconsistent modules and integration defects	Maintain one shared requirements document, API/data contracts, and acceptance criteria
External service or hosting limits affect deployment	Some functions may behave differently in the deployed environment	Confirm service limits, test deployment early, and document fallback or recovery steps
Scope expands late in development	Core features or testing may be left incomplete	Prioritize required workflows, record change requests, and assess impact before accepting changes

8. Review and Approval

This analysis should be reviewed when requirements change, a new stakeholder group is identified, or feedback reveals a change in priorities. Before final approval, the team should confirm the stakeholder list, validate assumptions where practical, and record any lecturer feedback.

Review Item	Status
Initial stakeholder groups identified	Drafted by the team
Stakeholder needs documented	Proposed; validate with users where possible
Power–interest levels assessed	Initial estimates; review as feedback is collected
Lecturer / evaluator review	Pending actual feedback
Final approval	Pending

9. Important Limitations

- This document is a planning artefact; it does not claim that interviews, surveys, or lecturer reviews have already occurred.
- Influence and priority levels are estimates and may change after validation.
- The project does not include AI-powered features. Project-health alerts are based on explicit rules and recorded project data.
- Only stakeholders and workflows within the agreed TaskFlow scope should be treated as implementation commitments.
